

Agent harnesses & infrastructure

Run your agents with the tools and controls they need.

We build or deploy the environment that runs your agent, connects its tools and gives an operator control over tasks, limits and recovery.

Service overview

fortitudo.agency

A working agent also needs a way to be operated.

For an agent that needs deployment, a custom execution environment, or better operating controls.

If an existing harness fits, we can configure and deploy it rather than build another.

Execution tied to a local setup

The agent works in development but has no defined deployment or operating path.

Failures are hard to inspect

Task state, tool calls and retries are difficult to follow or recover.

Controls added too late

Permissions, usage limits and operator responsibilities are still undefined.

An operating environment for the agent you want to run.

An existing harness configured for your use, or a custom harness

Tool execution, task state and permission controls

Logs, evaluation hooks, usage limits and recovery paths

Deployment configuration and documentation for the operator

Why work with us.

Use an environment that fits the agent

We assess the existing harness or build the execution loop, tool interfaces and state the task requires.

Understand what happened in a run

Task state, logs and error handling give operators a way to inspect failures and recover work.

Set the operating limits

Permissions, time limits and usage controls are defined as part of the build, with responsibilities recorded for handover.

From the first conversation to a clear handover.

01 Inspect the agent and execution requirements.

02 Design model, tool and permission boundaries.

03 Build or deploy the harness and operating controls.

04 Test normal runs, failures and recovery with your operator.

First checkpoint: agree the runtime, tool access and operating limits before building or deploying the harness.

A working result, checked together.

We agree what success looks like before delivery, then review the work against it.

The harness executes the agreed tasks and tools.

Permissions and limits behave as configured.

An operator can inspect failures and recover a run.

Build the environment. Define the controls.

Custom harness creation

Build the execution loop, tool interfaces, model connections and task state around the way your agent needs to work.

Harness installation and deployment

Deploy a supported existing harness into the agreed environment. Connect accounts, configure access and verify operation after installation.

Operating controls

Add run inspection, error handling, retries, time and usage limits, approval boundaries and the controls an operator needs to manage the system.

Start at the right scale.

Agent harness and infrastructure

Create or deploy the environment an agent or team runs inside.

We agree the deliverables, responsibilities and review points in a written proposal.

A clear scope before the work begins.

What we need from you

The current code or platform, deployment access, required tools and operating constraints.

What shapes the scope

Existing versus custom harness · Execution environment and tools · Persistence, monitoring and recovery

Scope and responsibilities

Hosting, model usage and third-party subscriptions are listed separately. The proposal identifies the supported runtime and maintenance responsibility.

Your written proposal confirms price, timing, responsibilities, review points and final inclusions.

Before you decide.

Can you deploy a harness we already chose?

Yes. Installation and deployment can be scoped without commissioning a new harness.

Can you build the harness from scratch?

Yes. We define the required execution behavior and interfaces before the custom build.

Let's plan the environment.

Share the agent or harness you use, where it needs to run and the tools it must access. We'll define the deployment or build required.
