

Custom AI agents

Give AI a real job in your business.

We build an agent around a specific task, connect the tools and information it needs, and give your team a way to review its work.

[Service overview](#)

fortitudo.agency

An agent needs to work beyond the demo.

For a repeated task or product feature that needs an agent connected to real business systems.

If you need product configuration rather than a custom build, start with AI setup.

The agent lacks the right context

The instructions are there, but the information needed to complete the task is missing.

Disconnected tools

People still move inputs and outputs between the agent and the systems they use.

Results are hard to assess

There is no agreed way to check the output, handle mistakes or approve important actions.

An agent connected to the work, with checks built in.

A defined task, sample inputs and checks for a useful result

Context, memory, permissions and human review where needed

The agent or team, execution environment and required tool connections

Evaluation, deployment, operating guidance and ownership handover

Why work with us.

Find out what works on your task

We test realistic inputs and the uncertain model or tool behavior before building the wider workflow.

Choose what the agent can do

Tool access, permissions and review steps define where the agent can act and where your team stays involved.

See how the system is performing

Evaluation, cost limits and recovery are part of the scope, so the operator can inspect results and manage runs.

From the first conversation to a clear handover.

- | | | | |
|----|---|----|---|
| 01 | Define the task, data, permissions and examples of a useful result. | 02 | Test the uncertain model, tool and integration behavior first. |
| 03 | Build the workflow with evaluation, cost limits and recovery. | 04 | Roll out the agreed scope, document operation and hand over controls. |

First checkpoint: test the task, tools and uncertain model behavior against examples of a useful result.

A working result, checked together.

We agree what success looks like before delivery, then review the work against it.

The system is evaluated against representative tasks and agreed failure cases.

Permissions, review steps and recovery behave as specified.

Your operator can run the workflow, inspect outputs and manage costs.

Put the agent where the work happens.

Outreach agents

Research prospects from approved sources, prepare personalized outreach, route replies and update your CRM. Sending permissions, approved channels and review steps are defined with your team.

Personal assistants

Connect the documents, calendar, email and business tools you choose. Give the assistant useful context and clear permission to prepare, recommend or carry out specific tasks.

Build around the tools and evidence it needs.

Custom coding agents

Configure repository context, development tools, test commands and review workflows around your codebase. Build a repeatable path from task to checked change.

Financial analyst agents

Connect authorized data, extract information and prepare research, comparisons and reports with traceable sources. Your team reviews analysis and financial decisions.

Connect the agent to the application.

Agents inside your software

Add agent-powered features to an existing application or a new product. Connect accounts, product data, tools and the interface people use to give instructions and review results.

Custom Hermes and OpenClaw agents

Set up and customize the supported agent environment around your workflows. Define models, instructions, skills, tool access, memory and deployment with a documented operator handover.

Start at the right scale.

Custom agent build

One agent built around a defined business task, with its tools, context and review workflow.

Agent inside an application

An agent-powered product feature connected to the application's accounts, data and customer journey.

A clear scope before the work begins.

What we need from you

Task examples, authorized data and tool access, account eligibility, expected volume and an operational owner for approvals and review.

What shapes the scope

Task complexity and number of agents · Tools, context and data access · Evaluation, oversight and deployment

Scope and responsibilities

Provider access, model usage, hosting and third-party subscriptions are separate. Outreach requires authorized channels and consent practices. Financial-analysis agents support review; they do not promise returns or unrestricted trading. Agent teams do not imply unlimited autonomous business operation.

Your written proposal confirms price, timing, responsibilities, review points and final inclusions.

Before you decide.

Can you build teams, harnesses and creative workflows?

Yes. We scope custom agents, manager-and-worker teams, harnesses, context systems and image, video or audio workflows. Each gets a defined task, tool access and review process.

Can you set up tools we already use?

Yes. Setup and consulting can cover supported Hermes, OpenClaw, ChatGPT, Claude and other agent environments. We verify the exact product, available access and installation or API path before committing.

What does anti-slop mean in practice?

The output has to serve the task, follow your brand and stand up to review. We also offer Unslop engagements for existing websites and content that need design, editorial or functional repair.

Let's start with the task.

Show us the task, a few example inputs and the systems involved. We'll define the agent's job, access and how you'll judge its output.
