

Context systems & memory

Give your agents the context they keep missing.

We connect your business sources to the agent's context and memory, with retrieval, updates and access rules built around the information it needs.

[Service overview](#)

fortitudo.agency

The information exists. The agent needs a way to use it.

For agents that miss internal information, lose useful context or need the same briefing repeatedly.

A vector database is one option. We choose storage and search for the task.

The same briefing, again

People repeat information because an agent does not retain the context it needs.

Sources that are hard to find

Important business knowledge is spread across documents and systems.

Information without clear rules

Freshness, access, updates and deletion are not consistently defined.

Business knowledge your agents can retrieve and use.

An inventory of sources and a process for bringing them in

A vector database and retrieval where the task needs them

Context storage, access rules and update behavior

Retrieval checks, maintenance guidance and data handover

Why work with us.

Use the knowledge your business already has

We organize the sources, instructions and task context your agents need, with access agreed by the source owners.

Check what the agent can find

We test retrieval against real questions, rather than treating a connected database as a finished result.

Keep the information manageable

The system includes rules for updating, accessing and deleting the context that is stored.

From the first conversation to a clear handover.

01 Inventory sources and agent information needs.

02 Design storage, retrieval and access rules.

03 Connect ingestion and the agent's context tools.

04 Test retrieval, updates and access with representative tasks.

First checkpoint: inventory the sources and test questions, then agree storage, retrieval and access rules.

A working result, checked together.

We agree what success looks like before delivery, then review the work against it.

Representative questions retrieve relevant source material.

Source changes can be reflected through the agreed update process.

Access and deletion behavior match the agreed rules.

Organize, retrieve and maintain the context.

Context systems

Organize the instructions, business knowledge and task state that should inform an agent's work. Separate durable knowledge from temporary task context.

Vector databases and retrieval

Create the database, ingestion and search connection for the agreed sources. Test whether the right information is retrieved for representative questions.

Agent context storage

Install persistent storage for selected context and memory. Define updates, deletion, retention and who is allowed to read or write.

Start at the right scale.

Context and memory system

Business sources, ingestion, retrieval and persistent agent context.

We agree the deliverables, responsibilities and review points in a written proposal.

A clear scope before the work begins.

What we need from you

Authorized sources, source owners, representative questions and data retention requirements.

What shapes the scope

Source formats and volume · Freshness and access requirements · Retrieval quality and memory behavior

Scope and responsibilities

Storage, embedding and model usage costs are separate. Source access and the permitted uses of data must be agreed.

Your written proposal confirms price, timing, responsibilities, review points and final inclusions.

Before you decide.

Do we need a vector database for everything?

No. We choose structured storage, search, vector retrieval or a combination based on the information and task.

Can you connect context to existing agents?

Yes. The connection can be implemented through the agent's supported tools, APIs or harness.

Let's connect the right context.

Bring the sources your agents should use and questions they struggle to answer. We'll map the context, retrieval and update requirements.
