

# Agent teams

A coordinated agent team with assigned roles, shared context and a reviewed result.

For product buildouts and business operations that need several kinds of work to happen together.

Design. Development. Delivery.

# What your business needs.

Build a team of agents that can divide a product or business workflow into jobs, share context and bring the result back for review.

Who this is for

For product buildouts and business operations that need several kinds of work to happen together.

# What we deliver.

A coordinated agent team with assigned roles, shared context and a reviewed result.

01 A manager role, specialist workers and a task assignment workflow

02 Shared context, handoff rules and tool permissions for each role

03 A review step that checks and combines worker outputs

04 Deployment, run visibility and an operating handover

# The work, in detail.

## Product buildout teams

Coordinate planning, research, coding, testing and review around your product. Give each worker a bounded task and have the manager reconcile the results.

## Business operations teams

Connect defined research, reporting, customer operations and administrative workflows. Add the tools and approval steps appropriate to each job.

# The work, in detail.

## Coordination and recovery

Define who can assign work, how workers exchange context, when the manager escalates and what happens when a task fails or stalls.

# A scope built around you.

## Manager and worker teams

An orchestrated team for an agreed product or operating workflow.

# From brief to handover.

- 01 Map the work and the roles it requires.
- 02 Define handoffs, shared context and permissions.
- 03 Implement the manager, workers and review workflow.
- 04 Run representative jobs and hand over operating controls.

# How we assess the work.

Work reaches the intended specialist with the necessary context.

The manager reviews and combines outputs before presenting completion.

Failed and blocked jobs are visible and can be recovered.

# What shapes the proposal.

Number of roles and workflows

Tool permissions and shared context

Review, recovery and operating volume

Autonomy is agreed per workflow. A team supporting business operations is not an unrestricted promise to run the entire business. Model usage and hosting are separate.

Price, timing and responsibilities are agreed in the proposal. Third-party fees and ongoing support are identified separately.

# A clear start. Practical ownership.

## What we need from you

A workflow map, representative jobs, tool access and the person responsible for approvals.

## What happens next

Bring a workflow that involves several people or tools. We will map where a coordinated team can help.
