

Context systems & memory

A connected context and memory system that agents can retrieve from and update as agreed.

For agents that lose useful context, cannot find internal information or rely on repeated manual briefings.

Design. Development. Delivery.

What your business needs.

Build context storage, vector databases and retrieval around your business sources, with control over what stays current and who can access it.

Who this is for

For agents that lose useful context, cannot find internal information or rely on repeated manual briefings.

What we deliver.

A connected context and memory system that agents can retrieve from and update as agreed.

01 A source inventory and ingestion workflow

02 Vector database and retrieval where the workload needs them

03 Agent context storage, access rules and update behavior

04 Retrieval checks, maintenance instructions and data handover

The work, in detail.

Context systems

Organize the instructions, business knowledge and task state that should inform an agent's work. Separate durable knowledge from temporary task context.

Vector databases and retrieval

Create the database, ingestion and search connection for the agreed sources. Test whether the right information is retrieved for representative questions.

The work, in detail.

Agent context storage

Install persistent storage for selected context and memory. Define updates, deletion, retention and who is allowed to read or write.

A scope built around you.

Context and memory system

Business sources, ingestion, retrieval and persistent agent context.

From brief to handover.

- 01 Inventory sources and agent information needs.
- 02 Design storage, retrieval and access rules.
- 03 Connect ingestion and the agent's context tools.
- 04 Test retrieval, updates and access with representative tasks.

How we assess the work.

Representative questions retrieve relevant source material.

Source changes can be reflected through the agreed update process.

Access and deletion behavior match the agreed rules.

What shapes the proposal.

Source formats and volume

Freshness and access requirements

Retrieval quality and memory behavior

Storage, embedding and model usage costs are separate. Source access and the permitted uses of data must be agreed.

Price, timing and responsibilities are agreed in the proposal. Third-party fees and ongoing support are identified separately.

A clear start. Practical ownership.

What we need from you

Authorized sources, source owners, representative questions and data retention requirements.

What happens next

Bring the sources your agents should use and examples of what they fail to find.
