

Jev implementation

A tested Jev integration for a specific decision in your system.

For teams choosing a model, classifying requests, reviewing agent output or deciding when a workflow needs escalation.

Design. Development. Delivery.

What your business needs.

Integrate TypeSafe AI's Jev into routing, classification and evaluation. The result feeds a defined branch in your application or agent harness.

Who this is for

For teams choosing a model, classifying requests, reviewing agent output or deciding when a workflow needs escalation.

What we deliver.

A tested Jev integration for a specific decision in your system.

01 A defined decision schema and representative test examples

02 Jev API or supported LangChain integration in the application or harness

03 Thresholds, routing branches and fallback behavior

04 Evaluation results and documentation for maintaining the integration

The work, in detail.

Model and task routing

Classify an incoming task and use the result to select the next model, worker or workflow branch.

Classification and prioritization

Turn context into typed decisions your software can act on, such as request category, priority or whether a review is needed.

The work, in detail.

Agent evaluation

Apply defined criteria to agent output or traces. Compare the decisions with reviewed examples before using the results to control a workflow.

Thresholds and fallback

Define how confidence affects the next action and what happens when the result is uncertain or the provider is unavailable.

A scope built around you.

Jev decision integration

One defined decision, its application connection and a representative evaluation set.

From brief to handover.

- 01 Choose the decision and define the possible results.
- 02 Prepare examples and review the expected decisions.
- 03 Connect Jev and implement thresholds and fallback paths.
- 04 Evaluate the integration and document the operating tradeoffs.

How we assess the work.

Responses are parsed into the agreed decision schema.

Reviewed examples exercise each route and uncertainty path.

Provider errors and low-confidence outcomes reach the defined fallback.

What shapes the proposal.

Number of decisions

Harness or application integration

Test data and evaluation depth

Jev returns structured decisions rather than generated text or media. We measure suitability on your examples; vendor speed and cost claims are not a project guarantee.

Price, timing and responsibilities are agreed in the proposal. Third-party fees and ongoing support are identified separately.

A clear start. Practical ownership.

What we need from you

Representative inputs, expected decisions, application access and a TypeSafe AI account with the required access.

What happens next

Show us where your system makes a repeated decision and what should happen next.
