

Agent harnesses & infrastructure

Give your agents a dependable place to work.

An execution environment that connects the model, tools, permissions and operating controls.

Service overview

fortitudo.agency

When the experiment needs an operating environment.

For a custom agent, an existing harness that needs deployment, or a team moving beyond a local experiment.

Execution tied to a local setup

The agent works in development but has no defined deployment or operating path.

Failures are hard to inspect

Task state, tool calls and retries are difficult to follow or recover.

Controls added too late

Permissions, usage limits and operator responsibilities are still undefined.

Execution, tools and operating controls. Together.

A configured or custom-built agent
harness

Tool execution, task state and
permission boundaries

Logs, evaluation hooks, usage limits
and recovery paths

Deployment configuration and
operator documentation

Why work with us.

An environment that fits

We configure an existing harness or build the execution behavior your agent requires.

Visibility into the run

Task state, logs and recovery paths help operators understand what happened.

Controls from the start

Tool permissions, time and usage limits are part of the agreed build.

From the first conversation to a clear handover.

01 Inspect the agent and execution requirements.

02 Design model, tool and permission boundaries.

03 Build or deploy the harness and operating controls.

04 Test normal runs, failures and recovery with your operator.

A working result, checked together.

We agree what success looks like before delivery, then review the work against it.

The harness executes the agreed tasks and tools.

Permissions and limits behave as configured.

An operator can inspect failures and recover a run.

Build the environment. Define the controls.

Custom harness creation

Build the execution loop, tool interfaces, model connections and task state around the way your agent needs to work.

Harness installation and deployment

Deploy a supported existing harness into the agreed environment. Connect accounts, configure access and verify operation after installation.

Operating controls

Add run inspection, error handling, retries, time and usage limits, approval boundaries and the controls an operator needs to manage the system.

Start at the right scale.

Agent harness and infrastructure

Create or deploy the environment an agent or team runs inside.

We agree the deliverables, responsibilities and review points in a written proposal.

A clear scope before the work begins.

What we need from you

The current code or platform, deployment access, required tools and operating constraints.

What shapes the scope

Existing versus custom harness · Execution environment and tools · Persistence, monitoring and recovery

Scope and responsibilities

Hosting, model usage and third-party subscriptions are listed separately. The proposal identifies the supported runtime and maintenance responsibility.

Your written proposal confirms price, timing, responsibilities, review points and final inclusions.

Before you decide.

Can you deploy a harness we already chose?

Yes. Installation and deployment can be scoped without commissioning a new harness.

Can you build the harness from scratch?

Yes. We define the required execution behavior and interfaces before the custom build.

Let's plan the environment.

Share the agent or harness you have and where it needs to run.
