

Agent teams

Turn separate agents into a coordinated team.

A coordinated agent team with assigned roles, shared context and a reviewed result.

Service overview

fortitudo.agency

When more agents create more coordination work.

For product buildouts and business operations that need several kinds of work to happen together.

Work without clear ownership

Tasks overlap or disappear between agents with loosely defined roles.

Context lost at handoff

Each worker starts again because the relevant information does not travel with the job.

Outputs without a reviewed result

Separate answers arrive, but someone still has to check and combine them.

The right roles. A shared workflow.

A manager role, specialist workers and a task assignment workflow

Shared context, handoff rules and tool permissions for each role

A review step that checks and combines worker outputs

Deployment, run visibility and an operating handover

Why work with us.

Roles built around the work

We map the workflow before assigning a manager and specialist workers.

Deliberate handoffs

Shared context, tool permissions and escalation rules connect each stage.

One reviewable result

The manager reconciles outputs, while failed or blocked jobs remain visible.

From the first conversation to a clear handover.

01 Map the work and the roles it requires.

02 Define handoffs, shared context and permissions.

03 Implement the manager, workers and review workflow.

04 Run representative jobs and hand over operating controls.

A working result, checked together.

We agree what success looks like before delivery, then review the work against it.

Work reaches the intended specialist with the necessary context.

The manager reviews and combines outputs before presenting completion.

Failed and blocked jobs are visible and can be recovered.

Build the team around the workflow.

Product buildout teams

Coordinate planning, research, coding, testing and review around your product. Give each worker a bounded task and have the manager reconcile the results.

Business operations teams

Connect defined research, reporting, customer operations and administrative workflows. Add the tools and approval steps appropriate to each job.

Coordination and recovery

Define who can assign work, how workers exchange context, when the manager escalates and what happens when a task fails or stalls.

Start at the right scale.

Manager and worker teams

An orchestrated team for an agreed product or operating workflow.

We agree the deliverables, responsibilities and review points in a written proposal.

A clear scope before the work begins.

What we need from you

A workflow map, representative jobs, tool access and the person responsible for approvals.

What shapes the scope

Number of roles and workflows · Tool permissions and shared context · Review, recovery and operating volume

Scope and responsibilities

Autonomy is agreed per workflow. A team supporting business operations is not an unrestricted promise to run the entire business. Model usage and hosting are separate.

Your written proposal confirms price, timing, responsibilities, review points and final inclusions.

Before you decide.

Can a team help run business operations?

Yes. We can build around defined operating workflows, then extend the team as tasks and results are reviewed. Consequential actions retain the approvals you specify.

Can we use our existing agents?

Yes. We review their interfaces and reliability before connecting them to the team.

Let's map your team's work.

Bring a workflow that involves several people or tools. We will map where a coordinated team can help.
