

Software

Build the product your business actually needs.

The public website, customer application and admin tools, built and deployed together.

Service overview

fortitudo.agency

When the tools no longer fit the way you work.

Launch a software business or replace fragmented tools with one application built around your operation.

A fragmented experience

Customers, staff and owners work across tools that were never designed together.

A prototype without a path to launch

The idea is visible, but accounts, data, integrations and operations remain unfinished.

Unclear ownership

You need to know who controls the code, deployment and data after delivery.

The website. The application. The tools to run it.

A branded marketing website with the agreed product and resource pages

Accounts, onboarding and the core customer workflows

Admin tools, data storage, email and required API connections

Frontend and backend deployment, code and data handover

Why work with us.

One coherent product

The public website, customer application and owner tools are built around the same journeys.

A useful first release

We define the priority workflows and distinguish a prototype from a production build.

A practical handover

Commissioned code, deployment and data are handed over under the agreed terms; support is optional.

From the first conversation to a clear handover.

01 Define the users, business model, permissions and required product journeys.

02 Review the brand, architecture, interface and representative working slice.

03 Build and test customer, admin and integration behavior.

04 Deploy the frontend and backend, transfer the agreed assets and document operations.

A working result, checked together.

We agree what success looks like before delivery, then review the work against it.

A customer can sign up and complete the agreed core journey.

Authorized owners can manage the agreed users, transactions and operations.

Data persists correctly and the frontend, backend and integrations work together.

Connect the first visit to the product.

The public product website

Branded marketing pages for the product, solutions, resources, blog, About, Contact and approved legal content. Genuine testimonials and relevant calls to action connect the website to the application.

Accounts and customer experience

Custom account setup, onboarding, the product dashboard, profile and settings. We design the customer journey around the product's actual features, roles and data.

Build for customers and the people running it.

The application itself

Booking systems, CRMs, social and community platforms, B2B and B2C applications, internal tools and Web3 products. We agree the product-specific capabilities and acceptance scenarios before development.

The owner's dashboard

Authorized user management, refund operations, financial visibility and other agreed administrative tools. Roles and access are enforced around the operations each person is allowed to perform.

Connect the data. Hand over the product.

Data and integrations

Custom databases, third-party data APIs, email, custom APIs and MCP interfaces where needed. Data ownership, vendor dependencies and operating costs are documented.

Deployment and ownership

Frontend and backend deployment assistance, source code, configuration guidance and a practical handover. Your accounts and data remain yours. Payment milestones, commissioned IP transfer and third-party licenses are stated in the agreement.

Start at the right scale.

Complete software product

The public site, customer application, admin tools, integrations and deployment in one scoped engagement.

Product prototype

A representative vertical slice to test a product decision before a larger build.

One working business workflow

A focused implementation connecting a specific task and its systems.

Booking systems

Scheduling, availability and the booking exceptions your business needs.

Extend or improve what you have.

CRM build or extension

Customer records, workflows and integrations around your operating process.

Web3 implementation

Begin with a bounded integration or prototype; production transactions require additional security and operational scope.

Social and community products

A scoped pilot or complete product with accounts, interactions and moderation requirements.

Custom API

A documented interface connecting your product, data and other systems.

A clear scope before the work begins.

What we need from you

Product goals, priority features, user roles, existing data, provider accounts, approved business content and an owner for acceptance decisions.

What shapes the scope

Core workflows and user roles · Integrations and data migration · Admin, payment and deployment requirements

Scope and responsibilities

Feature scope, integrations, data volumes and acceptance tests determine the project. A prototype is not a complete production product. Hosting, vendor usage and optional retainers are separate; ownership does not require an ongoing retainer.

Your written proposal confirms price, timing, responsibilities, review points and final inclusions.

Before you decide.

Who owns the software?

You own the project code, deployment and data under the agreed terms. We provide the handover and deployment assistance.

Third-party services retain their own licensing terms; an ongoing retainer is optional.

Can we start with a smaller release?

Yes. A prototype or one complete workflow can test the important product decision before the wider build. The proposal distinguishes a prototype from production-ready software.

Let's define your first release.

Bring the product idea or existing workflow. We will define the first release, its boundaries and how you will review it.
