

MCP, APIs & AI integrations

Connect the tools your work depends on.

A working, documented connection between your agent or application and the required system.

Service overview

fortitudo.agency

When one missing connection holds the workflow back.

For a missing integration, a private business tool that needs an agent interface, or a product that needs its own API.

Manual transfer between systems

People copy data or repeat actions because applications do not share a working interface.

Private tools beyond the agent's reach

A useful business system has no supported agent-facing connection.

Access without clear boundaries

Authentication, permitted actions and failure behavior need to be defined together.

A working interface between your systems.

The agreed MCP integration, custom server or API

Authentication, permissions and documented tool contracts

Data mapping, error handling and integration tests

Deployment guidance and source/configuration handover

Why work with us.

The right connection for the job

We use an existing supported integration where it fits, or build the missing API or MCP interface.

Permissions built into the interface

Tool contracts, validation and authorization define what each client can do.

A connection your team can maintain

The handover includes interface documentation, deployment details and agreed operational checks.

From the first conversation to a clear handover.

01 Define the systems, actions and data to connect.

02 Agree contracts, authentication and permissions.

03 Implement and deploy the interface.

04 Test permitted actions, denied access and failure behavior.

A working result, checked together.

We agree what success looks like before delivery, then review the work against it.

The intended client can complete the agreed operations.

Unauthorized requests and invalid inputs are handled correctly.

The owner receives usable interface documentation and deployment details.

Connect existing tools or build the missing interface.

MCP installation and integration

Configure an existing supported MCP server, connect it to the intended client and verify the tools against real permitted tasks.

Custom MCP creation

Expose your business systems through purpose-built tools. Define inputs, outputs, authentication and the actions each agent is allowed to perform.

Bring the connection into the product.

Custom API creation

Build endpoints for your product or business workflow, including validation, authorization, data handling and documentation.

AI tools inside applications

Connect model and agent capabilities to product accounts, interfaces and existing workflows. Define how results are returned and failures reach the user.

Start at the right scale.

MCP integration

Connect and verify an existing supported server.

Custom MCP server

Create a tool interface for your private system.

Custom API

Build and document application endpoints.

AI tool integration

Connect an agent or model to a product workflow.

A clear scope before the work begins.

What we need from you

System documentation, authorized accounts, sample data and access requirements.

What shapes the scope

Systems and endpoint count · Authentication and data mapping · Deployment and operational requirements

Scope and responsibilities

Third-party API access, limits and fees depend on the provider. The proposal identifies supported operations and maintenance responsibility.

Your written proposal confirms price, timing, responsibilities, review points and final inclusions.

Before you decide.

Can you build both the MCP server and API?

Yes. They can be scoped together when an application needs both a conventional API and an agent-facing tool interface.

Can you connect a tool that already has an MCP server?

Yes. We can install, configure and verify the existing integration instead of building a replacement.

Let's connect your systems.

Show us the systems you need to connect and the actions you want to expose.
