

Agent harnesses & infrastructure

An execution environment that connects the model, tools, permissions and operating controls.

Agent Harness Build

For a custom agent, an existing harness that needs deployment, or a team moving beyond a local experiment.

A configured or custom-built agent harness

Tool execution, task state and permission boundaries

Logs, evaluation hooks, usage limits and recovery paths

Deployment configuration and operator documentation

Scope. Delivery. Ownership.

Read the offer. Share it with your team. Start a conversation.

Agent Harness Build

The result

An execution environment that connects the model, tools, permissions and operating controls.

01 A configured or custom-built agent harness

02 Tool execution, task state and permission boundaries

03 Logs, evaluation hooks, usage limits and recovery paths

04 Deployment configuration and operator documentation

Where we start

Share the agent or harness you have and where it needs to run.

What we can build.

Custom harness creation

Build the execution loop, tool interfaces, model connections and task state around the way your agent needs to work.

Harness installation and deployment

Deploy a supported existing harness into the agreed environment. Connect accounts, configure access and verify operation after installation.

Operating controls

Add run inspection, error handling, retries, time and usage limits, approval boundaries and the controls an operator needs to manage the system.

Choose the work you need.

A focused engagement or a complete build. Each option is scoped and quoted for your business.

Agent harness and infrastructure

Create or deploy the environment an agent or team runs inside.

Your proposal brings the selected work into one scope, with review milestones, responsibilities and a project price.

A clear path to handover.

01

Inspect the agent and execution requirements.

02

Design model, tool and permission boundaries.

03

Build or deploy the harness and operating controls.

04

Test normal runs, failures and recovery with your operator.

How we review the result

The harness executes the agreed tasks and tools.

Permissions and limits behave as configured.

An operator can inspect failures and recover a run.

Know what you are agreeing to.

What we need from you

The current code or platform, deployment access, required tools and operating constraints.

Scope and dependencies

Hosting, model usage and third-party subscriptions are listed separately. The proposal identifies the supported runtime and maintenance responsibility.

Your proposal

Deliverables, milestones, review rounds, responsibilities, price and timeline are set out before work starts. Third-party costs and changes to scope are identified separately.

After handover

Optional care and improvement retainers have an agreed scope and support terms. Ongoing support is a separate choice; ownership does not depend on buying a retainer.

Discuss your harness.
