

Context systems & memory

A connected context and memory system that agents can retrieve from and update as agreed.

Agent Context System

For agents that lose useful context, cannot find internal information or rely on repeated manual briefings.

A source inventory and ingestion workflow

Vector database and retrieval where the workload needs them

Agent context storage, access rules and update behavior

Retrieval checks, maintenance instructions and data handover

Scope. Delivery. Ownership.

Agent Context System

The result

A connected context and memory system that agents can retrieve from and update as agreed.

01 A source inventory and ingestion workflow

02 Vector database and retrieval where the workload needs them

03 Agent context storage, access rules and update behavior

04 Retrieval checks, maintenance instructions and data handover

Where we start

Bring the sources your agents should use and examples of what they fail to find.

What we can build.

Context systems

Organize the instructions, business knowledge and task state that should inform an agent's work. Separate durable knowledge from temporary task context.

Vector databases and retrieval

Create the database, ingestion and search connection for the agreed sources. Test whether the right information is retrieved for representative questions.

Agent context storage

Install persistent storage for selected context and memory. Define updates, deletion, retention and who is allowed to read or write.

Choose the work you need.

A focused engagement or a complete build. Each option is scoped and quoted for your business.

Context and memory system

Business sources, ingestion, retrieval and persistent agent context.

Your proposal brings the selected work into one scope, with review milestones, responsibilities and a project price.

A clear path to handover.

01

Inventory sources and agent information needs.

02

Design storage, retrieval and access rules.

03

Connect ingestion and the agent's context tools.

04

Test retrieval, updates and access with representative tasks.

How we review the result

Representative questions retrieve relevant source material.

Source changes can be reflected through the agreed update process.

Access and deletion behavior match the agreed rules.

Know what you are agreeing to.

What we need from you

Authorized sources, source owners, representative questions and data retention requirements.

Scope and dependencies

Storage, embedding and model usage costs are separate. Source access and the permitted uses of data must be agreed.

Your proposal

Deliverables, milestones, review rounds, responsibilities, price and timeline are set out before work starts. Third-party costs and changes to scope are identified separately.

After handover

Optional care and improvement retainers have an agreed scope and support terms. Ongoing support is a separate choice; ownership does not depend on buying a retainer.

Plan your context system.
