

Jev implementation

A tested Jev integration for a specific decision in your system.

Jev Decision Integration

For teams choosing a model, classifying requests, reviewing agent output or deciding when a workflow needs escalation.

A defined decision schema and representative test examples

Jev API or supported LangChain integration in the application or harness

Thresholds, routing branches and fallback behavior

Evaluation results and documentation for maintaining the integration

Scope. Delivery. Ownership.

Read the offer. Share it with your team. Start a conversation.

Jev Decision Integration

The result

A tested Jev integration for a specific decision in your system.

01 A defined decision schema and representative test examples

02 Jev API or supported LangChain integration in the application or harness

03 Thresholds, routing branches and fallback behavior

04 Evaluation results and documentation for maintaining the integration

Where we start

Show us where your system makes a repeated decision and what should happen next.

What we can build.

Model and task routing

Classify an incoming task and use the result to select the next model, worker or workflow branch.

Classification and prioritization

Turn context into typed decisions your software can act on, such as request category, priority or whether a review is needed.

Agent evaluation

Apply defined criteria to agent output or traces. Compare the decisions with reviewed examples before using the results to control a workflow.

Thresholds and fallback

Define how confidence affects the next action and what happens when the result is uncertain or the provider is unavailable.

Choose the work you need.

A focused engagement or a complete build. Each option is scoped and quoted for your business.

Jev decision integration

One defined decision, its application connection and a representative evaluation set.

Your proposal brings the selected work into one scope, with review milestones, responsibilities and a project price.

A clear path to handover.

01

Choose the decision and define the possible results.

02

Prepare examples and review the expected decisions.

03

Connect Jev and implement thresholds and fallback paths.

04

Evaluate the integration and document the operating tradeoffs.

How we review the result

Responses are parsed into the agreed decision schema.

Reviewed examples exercise each route and uncertainty path.

Provider errors and low-confidence outcomes reach the defined fallback.

Know what you are agreeing to.

What we need from you

Representative inputs, expected decisions, application access and a TypeSafe AI account with the required access.

Scope and dependencies

Jev returns structured decisions rather than generated text or media. We measure suitability on your examples; vendor speed and cost claims are not a project guarantee.

Your proposal

Deliverables, milestones, review rounds, responsibilities, price and timeline are set out before work starts. Third-party costs and changes to scope are identified separately.

After handover

Optional care and improvement retainers have an agreed scope and support terms. Ongoing support is a separate choice; ownership does not depend on buying a retainer.

Discuss Jev integration.
