

MCP, APIs & AI integrations

A working, documented connection between your agent or application and the required system.

Connected Tools Build

For a missing integration, a private business tool that needs an agent interface, or a product that needs its own API.

The agreed MCP integration, custom server or API

Authentication, permissions and documented tool contracts

Data mapping, error handling and integration tests

Deployment guidance and source/configuration handover

Scope. Delivery. Ownership.

Read the offer. Share it with your team. Start a conversation.

Connected Tools Build

The result

A working, documented connection between your agent or application and the required system.

01 The agreed MCP integration, custom server or API

02 Authentication, permissions and documented tool contracts

03 Data mapping, error handling and integration tests

04 Deployment guidance and source/configuration handover

Where we start

Show us the systems you need to connect and the actions you want to expose.

What we can build.

MCP installation and integration

Configure an existing supported MCP server, connect it to the intended client and verify the tools against real permitted tasks.

Custom MCP creation

Expose your business systems through purpose-built tools. Define inputs, outputs, authentication and the actions each agent is allowed to perform.

Custom API creation

Build endpoints for your product or business workflow, including validation, authorization, data handling and documentation.

AI tools inside applications

Connect model and agent capabilities to product accounts, interfaces and existing workflows. Define how results are returned and failures reach the user.

Choose the work you need.

A focused engagement or a complete build. Each option is scoped and quoted for your business.

MCP integration

Connect and verify an existing supported server.

Custom MCP server

Create a tool interface for your private system.

Custom API

Build and document application endpoints.

AI tool integration

Connect an agent or model to a product workflow.

Your proposal brings the selected work into one scope, with review milestones, responsibilities and a project price.

A clear path to handover.

01

Define the systems, actions and data to connect.

02

Agree contracts, authentication and permissions.

03

Implement and deploy the interface.

04

Test permitted actions, denied access and failure behavior.

How we review the result

The intended client can complete the agreed operations.

Unauthorized requests and invalid inputs are handled correctly.

The owner receives usable interface documentation and deployment details.

Know what you are agreeing to.

What we need from you

System documentation, authorized accounts, sample data and access requirements.

Scope and dependencies

Third-party API access, limits and fees depend on the provider. The proposal identifies supported operations and maintenance responsibility.

Your proposal

Deliverables, milestones, review rounds, responsibilities, price and timeline are set out before work starts. Third-party costs and changes to scope are identified separately.

After handover

Optional care and improvement retainers have an agreed scope and support terms. Ongoing support is a separate choice; ownership does not depend on buying a retainer.

Connect your tools.
