

Software

The public website, customer application and admin tools, built and deployed together.

Service overview / Scope / Delivery / Ownership

fortitudo.agency

What your business needs.

We build complete software products: the public website, customer experience, product features and owner dashboard, with frontend and backend deployment and a clear handover.

Who this is for

Launch a software business or replace fragmented tools with one application built around your operation.

What we deliver.

One coherent product with an agreed feature scope. You own the commissioned code, deployment and data, with optional support after handover.

01 A branded marketing website with the agreed product and resource pages

02 Accounts, onboarding and the core customer workflows

03 Admin tools, data storage, email and required API connections

04 Frontend and backend deployment, code and data handover

The work, in detail.

The public product website

Branded marketing pages for the product, solutions, resources, blog, About, Contact and approved legal content. Genuine testimonials and relevant calls to action connect the website to the application.

Accounts and customer experience

Custom account setup, onboarding, the product dashboard, profile and settings. We design the customer journey around the product's actual features, roles and data.

The work, in detail.

The application itself

Booking systems, CRMs, social and community platforms, B2B and B2C applications, internal tools and Web3 products. We agree the product-specific capabilities and acceptance scenarios before development.

The owner's dashboard

Authorized user management, refund operations, financial visibility and other agreed administrative tools. Roles and access are enforced around the operations each person is allowed to perform.

The work, in detail.

Data and integrations

Custom databases, third-party data APIs, email, custom APIs and MCP interfaces where needed. Data ownership, vendor dependencies and operating costs are documented.

Deployment and ownership

Frontend and backend deployment assistance, source code, configuration guidance and a practical handover. Your accounts and data remain yours. Payment milestones, commissioned IP transfer and third-party licenses are stated in the agreement.

A scope built around you.

Complete software product

The public site, customer application, admin tools, integrations and deployment in one scoped engagement.

One working business workflow

A focused implementation connecting a specific task and its systems.

Product prototype

A representative vertical slice to test a product decision before a larger build.

Booking systems

Scheduling, availability and the booking exceptions your business needs.

A scope built around you.

CRM build or extension

Customer records, workflows and integrations around your operating process.

Social and community products

A scoped pilot or complete product with accounts, interactions and moderation requirements.

Web3 implementation

Begin with a bounded integration or prototype; production transactions require additional security and operational scope.

Custom API

A documented interface connecting your product, data and other systems.

From brief to handover.

- 01 Define the users, business model, permissions and required product journeys.
- 02 Review the brand, architecture, interface and representative working slice.
- 03 Build and test customer, admin and integration behavior.
- 04 Deploy the frontend and backend, transfer the agreed assets and document operations.

How we assess the work.

A customer can sign up and complete the agreed core journey.

Authorized owners can manage the agreed users, transactions and operations.

Data persists correctly and the frontend, backend and integrations work together.

What shapes the proposal.

Core workflows and user roles

Integrations and data migration

Admin, payment and deployment requirements

Feature scope, integrations, data volumes and acceptance tests determine the project. A prototype is not a complete production product. Hosting, vendor usage and optional retainers are separate; ownership does not require an ongoing retainer.

Price, timing and responsibilities are agreed in the proposal. Third-party fees and ongoing support are identified separately.

A clear start. Practical ownership.

What we need from you

Product goals, priority features, user roles, existing data, provider accounts, approved business content and an owner for acceptance decisions.

What happens next

Bring the product idea or existing workflow. We will define the first release, its boundaries and how you will review it.
